

Fork Face Buffer (FFB)

The fork face buffer is a retro-fitted safety device for use with any size fork section. The buffers consist of a mild steel pressed section with a plasticised foam buffer bonded to the front face to ensure delicate and fragile loads are kept clear of carriage and fork shank contact. The buffer is retained via four securing screw pins to ensure an even and safe fitment to the fork shank, as well as easy and quick removal when lifting is complete
